	Full name 2_RollNumber
	Full name 3_RollNumber
	Full name 4_RollNumber
Class	…

Abstract

A summary of the entire report in 150-250 words. Include the problem, objectives, main methods, key results, and conclusions

Start with context: Introduce the topic and its importance.

State the problem statement and objectives.

Summarize the methodology (analysis + experiments).

Present key results (use data from experiments).

End with implications.

Key words:

1. Introduction

Background and Importance: Introduce the topic, and current importance. Use diagrams for illustration

Problem Statement: State the issues/challenges (e.g., performance, cost).

Objectives & Outline: State the goals (review literature, analyze, experiment) and outline the report.

2. Literature Review

Overview of literature (800-1200 words), analyzing sources from classic to new.

Briefly mention the evolution from single-core to multicore systems (e.g., Intel Core i7 vs. older Pentium architectures).

3. Methodology

Describe the research methods (400-600 words).

3.1 Analysis of Key Components

Analyze theory, use comparison tables or diagrams.

3.2 Experimental Setup

Describe tools (example: https://personal.ntu.edu.sg/smitha/ParaCache/Paracache/start.html) test cases, metrics (e.g., Direct Mapped Cache)

4. Results

Present findings (300-500 words), using tables/charts.

Providing data from experiments, illustrate with charts.

5. Discussion

Analyze results (400-600 words): trade-offs, implications, limitations.

Link to literature, discuss trends, suggest future work.

6. Conclusion

Summarize and recommend (200-300 words).

Review objectives, emphasize findings, propose
